Rangeland health reference sheet

Interpreting Indicators of Rangeland Health is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

Composition (Indicators 10 and 12) based on	Annual Production

Indicators

mber and extent of rills: None to some, severe sheet & rill erosion hazard esence of water flow patterns: None to some
esence of water flow patterns: None to some
mber and height of erosional pedestals or terracettes: None to some
re ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not re ground): 5-15%
mber of gullies and erosion associated with gullies: None
tent of wind scoured, blowouts and/or depositional areas: None, slight wind erosion hazard
nount of litter movement (describe size and distance expected to travel): Fine - limited movement

	values): Moderately to significantly resistant to erosion; aggregate stability = 3-6					
9.	Soil surface structure and SOM content (include type of structure and A-horizon color and thickness): Shallow, well drained, with a very stony to extremely cobbly loam surface; low to moderate OM (1-3%)					
10.	Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff: Moderate ground cover (60-70%) and steep slopes (2-60%) moderately limit rainfall impact and overland flow					
11.	Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site): None					
12.	Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):					
	Dominant: Bluebunch wheatgrass > Sand dropseed > forbs > other grasses > shrubs					
	Sub-dominant:					
	Other:					
	Additional:					
13.	Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence): Normal decadence and mortality expected					
14.	Average percent litter cover (%) and depth (in):					
15.	Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annual-production): Favorable: 800, Normal: 600, Unfavorable: 400 lbs/acre/year at high RSI (HCPC)					
16.	Potential invasive (including noxious) species (native and non-native). List species which BOTH characterize degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not					

o.o.mai piant iep	plant reproductive capability: All species should be capable of reproducing annually
