

# **Ecological site R030XA107AZ** **Limy Slopes 3-6" p.z.**

Accessed: 05/19/2024

## **General information**

**Provisional.** A provisional ecological site description has undergone quality control and quality assurance review. It contains a working state and transition model and enough information to identify the ecological site.

**Figure 1. Mapped extent**

Areas shown in blue indicate the maximum mapped extent of this ecological site. Other ecological sites likely occur within the highlighted areas. It is also possible for this ecological site to occur outside of highlighted areas if detailed soil survey has not been completed or recently updated.

## **MLRA notes**

Major Land Resource Area (MLRA): 030X–Mojave Basin and Range

AZ CRA 30.1 – Lower Mohave Desert

Elevations range from 400 to 2500 feet and precipitation averages 3 to 6 inches per year. Vegetation includes creosotebush, white bursage, Mormon tea, and brittlebush. The soil temperature regime is hyperthermic and the soil moisture regime is typic aridic. This unit occurs within the Basin and Range Province and is characterized by broad basins, valleys, and old lakebeds. Widely spaced mountains trending north to south occur throughout the area. Isolated, short mountain ranges are separated by an aggraded desert plain. The mountains are fault blocks that have been tilted up. Long alluvial fans coalesce with dry lakebeds between some of the ranges.

**Table 1. Dominant plant species**

Tree	Not specified
Shrub	(1) <i>Larrea tridentata</i>
Herbaceous	Not specified

## **Physiographic features**

This ecological site occurs in an upland position on summits and backslopes of fan terraces. It occurs on all aspects.

**Table 2. Representative physiographic features**

Landforms	(1) Terrace
Flooding frequency	None
Ponding frequency	None
Elevation	457–914 m
Slope	15–35%
Aspect	Aspect is not a significant factor

## Climatic features

The 30-1AZ Lower Mohave Desert Shrub land resource unit is characterized by a hot, dry climate. The average annual rainfall is 3 to 6 inches, but it can be extremely variable (e.g. from 0 to 11 inches). There can be long periods when little or no precipitation is received. Most of the precipitation for the year could arrive in just a couple of storms. The soil moisture regime is typic aridic and the soil temperature regime is hyperthermic. Winter precipitation from November through April occurs as gentle rains from storms coming out of the Pacific Ocean. Snow is very rare and only falls in the highest mountains. A seasonal drought occurs in May and June. Summer/fall precipitation from July through October comes from spotty, unreliable, and sometimes violent thunderstorms. The moisture originates in the Gulf of Mexico (and the Pacific Ocean in the fall) and flows into the state on the north end of the Mexican monsoon. Strong winds are common, especially during the spring.

**Table 3. Representative climatic features**

Frost-free period (average)	325 days
Freeze-free period (average)	365 days
Precipitation total (average)	152 mm

## Influencing water features

### Soil features

The soil of this ecological site is very deep. Parent material is of mixed igneous and metamorphic alluvium materials from various formations. Available water capacity is low. Permeability is moderately rapid. Water erosion hazard is severe; wind erosion hazard is slight. Runoff is rapid. Soils are non-saline, non-sodic with pH of 8.0-8.2 (moderately alkaline). Soil moisture regime is typic aridic; temperature regime is hyperthermic.

A typical soil profile is:

A-0 to 2 inches; very gravelly loam; strongly effervescent

Bw-2 to 9 inches; very gravelly sand loam; violently effervescent

Bkq- 9 to 27 inches; very gravelly sandy loam; violently effervescent

Bk 27 to 40 inches; extremely gravelly sandy loam; violently effervescent

2C-40 to 60 inches; very gravelly loamy sand; violently effervescent

Soil mapping units correlated to this ecological site include map unit 627060, Huevi Series, Mohave County, AZ, Southern Part SSA and map unit 701013, Snapcan Series, Grand Canyon Area, AZ, Parts of Coconino and Mohave Counties.

**Table 4. Representative soil features**

Surface texture	(1) Very gravelly sandy loam (2) Extremely gravelly
-----------------	--

Family particle size	(1) Sandy
Drainage class	Well drained
Permeability class	Moderately rapid
Soil depth	152 cm
Surface fragment cover <=3"	40–60%
Surface fragment cover >3"	0–5%
Available water capacity (0-101.6cm)	7.62–12.7 cm
Calcium carbonate equivalent (0-101.6cm)	2–30%
Electrical conductivity (0-101.6cm)	0 mmhos/cm
Sodium adsorption ratio (0-101.6cm)	0
Soil reaction (1:1 water) (0-101.6cm)	7.4–8.4
Subsurface fragment volume <=3" (Depth not specified)	20–55%
Subsurface fragment volume >3" (Depth not specified)	0–5%

## Ecological dynamics

The plant communities found on an ecological site are naturally variable. Composition and production will vary with yearly conditions, location, aspect, and the natural variability of the soils. The historical climax plant community represents the natural potential plant communities found on relict or relatively undisturbed sites. Other plant communities described here represent plant communities that are known to occur when the site is disturbed by factors such as grazing, fire, or drought.

Production data provided in this site description is standardized to air-dry weight at the end of the summer growing season. The plant communities described in this site description are based on near normal rainfall years.

NRCS uses a Similarity Index to compare existing plant communities to the plant communities described here. Similarity Index is determined by comparing the production and composition of a plant community to the production and composition of a plant community described in this site description. To determine Similarity Index, compare the production (air-dry weight) of each species to that shown in the plant community description. For each species, count no more than the maximum amount shown for the species, and for each group, count no more than the maximum shown for the group. Divide the resulting total by the total normal year production shown in the plant community description. If rainfall has been significantly above or below normal, use the total production shown for above or below normal years. If field data is not collected at the end of the summer growing season, then the field data must be corrected to the end of the year production before comparing it to the site description. The growth curve can be used as a guide for estimating production at the end of the summer growing season.

## State and transition model

## State 1

### Historic Climax Plant Community

## Community 1.1

### Historic Climax Plant Community

The dominant aspect of the site is a desert shrub. Creosotebush, white bursage and white brittlebush are the major shrubs. Because of the low density of plants and the lack of desirable species for grazing, it is hard to measure degradation. A fire will not carry on this site and grazing is limited to annual grasses, forbs and low amounts of white bursage. Plant community changes are limited by low moisture and high temperatures.

Table 5. Annual production by plant type

Plant Type	Low (Kg/Hectare)	Representative Value (Kg/Hectare)	High (Kg/Hectare)
Shrub/Vine	74	83	84
Forb	4	11	15
Grass/Grasslike	1	4	4
<b>Total</b>	<b>79</b>	<b>98</b>	<b>103</b>

Table 6. Ground cover

Tree foliar cover	0%
Shrub/vine/liana foliar cover	0-2%

Grass/grasslike foliar cover	0%
Forb foliar cover	0%
Non-vascular plants	0%
Biological crusts	0%
Litter	0%
Surface fragments >0.25" and <=3"	0%
Surface fragments >3"	0%
Bedrock	0%
Water	0%
Bare ground	0%

**Table 7. Canopy structure (% cover)**

Height Above Ground (M)	Tree	Shrub/Vine	Grass/ Grasslike	Forb
<0.15	—	—	0-2%	0-2%
>0.15 <= 0.3	—	—	—	—
>0.3 <= 0.6	—	4-8%	—	—
>0.6 <= 1.4	—	—	—	—
>1.4 <= 4	—	—	—	—
>4 <= 12	—	—	—	—
>12 <= 24	—	—	—	—
>24 <= 37	—	—	—	—
>37	—	—	—	—

**Figure 4. Plant community growth curve (percent production by month).**  
**AZ3011, 30.1 3-6" p.z. all sites.** Growth begins in late winter, most growth occurs in the spring..

9				0–2	
	white ratany	KRGR	<i>Krameria grayi</i>	0–2	–
10				4–10	
	brittlebush	ENFA	<i>Encelia farinosa</i>	4–10	–
11				0–2	
	Shrub, other	2S	<i>Shrub, other</i>	0–2	–

### Animal community

Wildlife found on this ecological site include burro, desert tortoise, desert cottontail rabbit, lizard, blacktail rabbit, and snakes.

### Other information

The dominant aspect of the site is a desert shrub. Creosotebush, white bursage and white brittlebush are the major shrubs.

### Type locality

Location 1: Mohave County, AZ	
Township/Range/Section	T29N R22W S22

## Rangeland health reference sheet

Interpreting Indicators of Rangeland Health is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

Composition (Indicators 10 and 12) based on	Annual Production

## Indicators

1. **Number and extent of rills:** None. A cover of gravel and rock armor the soil surface against erosion.

---
2. **Presence of water flow patterns:** A few possible, but spaced no closer than 20 to 30 feet apart. This ecological site usually occurs on the side slopes of fairly narrow ridge tops. The occasional water flow pattern may be observed just above the natural drainages into the washes dissecting the fan terrace the site occurs on. The cover of gravel and rock armors the soil surface against erosion preventing water flow patterns from developing in other locations on the ecological site.

---
3. **Number and height of erosional pedestals or terracettes:** None. A cover of gravel and rock armors the soil surface against erosion and the creation of pedestals or terracettes.

---
4. **Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground):** Bare ground makes up 5 to 15 percent. Rock and gravel cover is 75 to 80 percent. Litter cover is 5 to 15 percent. Basal plant cover is generally less than 5 percent.

---
5. **Number of gullies and erosion associated with gullies:** Numerous drainages running approximately vertical to the direction of the ridge tops may be observed. These are natural and no active erosion is seen associated with them.

---

6. **Extent of wind scoured, blowouts and/or depositional areas:** None. A cover of gravel and rock armors the soil surface against wind erosion and the resulting scoured, blowout and/or depositional areas.
- 
7. **Amount of litter movement (describe size and distance expected to travel):** Litter is naturally concentrated underneath the scattered shrubs found on this ecological site. The residue of annual forbs and grasses, although naturally scarce, generally stays in place for several months after these plants have senesced due to the soil surface cover of gravel and rock found on this ecological site.
- 
8. **Soil surface (top few mm) resistance to erosion (stability values are averages - most sites will show a range of values):** No slake test information is available. The soil surface is very resistant to both water and wind erosion due to the cover of rocks and gravels.
- 
9. **Soil surface structure and SOM content (include type of structure and A-horizon color and thickness):** Weak thick platy structure; color is 10YR4/3 moist. The thickness of the A horizon is about 2 inches.
- 
10. **Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff:** This plant community is characterized by widely scattered shrubs with average spacing of 20 to 30 feet. Canopy cover of shrubs is 5 to 15 percent.
- 
11. **Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site):** No compaction layer exists on this ecological site. The soil surface cover of gravel and rock forms a somewhat impenetrable layer, but this is not due to compaction.
- 
12. **Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):**
- Dominant: Shrubs (75 to 85%) >>
- Sub-dominant: Forbs (5 to 15%) >, Grasses (1 to 5%)
- Other:
- Additional: During years of above average precipitation the ratio of shrubs to annual plants (dominantly annual forbs) will naturally change with the annually produced biomass produced and resulting percent composition of forbs increasing substantially while the biomass of the shrubs will increase only slightly.
- 
13. **Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence):** One to two percent of the perennial plants may be dead or dying due to drought or natural senescence at any given time. Dead branched in the creosote bush and occasionally white bursage are common and natural, increasing during drought periods.
- 
14. **Average percent litter cover (%) and depth ( in):** Litter is naturally concentrated under shrubs. Litter from winter

spring annual forb and grass production generally stays in place for several months due to the rock and gravel cover found in interspaces.

---

15. **Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annual-production):** Average annual production on this site is expected to be 75 to 125 lbs/ac. in a year of average precipitation.
  16. **Potential invasive (including noxious) species (native and non-native). List species which BOTH characterize degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not invasive plants. Note that unlike other indicators, we are describing what is NOT expected in the reference state for the ecological site:** Red brome (*Bromus rubens*, Mediterranean grass, *Schismus barbatus*, and filaree, *Erodium cicutarium* may be found on the site in very small amounts (< 1% or < 1 lb/ac.).
  17. **Perennial plant reproductive capability:** All plants native to this site are adapted to the climate and are capable of producing seeds, stolons, and/or rhizomes except during the most severe droughts.
-
