

Ecological site R040XA113AZ Loamy Slopes 10"-13" p.z.

Accessed: 05/19/2024

General information

Provisional. A provisional ecological site description has undergone quality control and quality assurance review. It contains a working state and transition model and enough information to identify the ecological site.

Figure 1. Mapped extent

Areas shown in blue indicate the maximum mapped extent of this ecological site. Other ecological sites likely occur within the highlighted areas. It is also possible for this ecological site to occur outside of highlighted areas if detailed soil survey has not been completed or recently updated.

MLRA notes

Major Land Resource Area (MLRA): 040X-Sonoran Basin and Range

AZ 40.1 – Upper Sonoran Desert

Elevations range from 2000 to 3200 feet and precipitation averages 10 to 13 inches per year. Vegetation includes saguaro, palo verde, mesquite, creosotebush, triangle bursage, prickly pear, cholla, limberbush, wolfberry, bush muhly, threeawns, ocotillo, and globe mallow. The soil temperature regime is thermic and the soil moisture regime is typic aridic. This unit occurs within the Basin and Range Physiographic Province and is characterized by numerous mountain ranges that rise abruptly from broad, plain-like valleys and basins. Igneous and metamorphic rock classes dominate the mountain ranges and sediments filling the basins represent combinations of fluvial, lacustrine, colluvial and alluvial deposits.

Table 1. Dominant plant species

Tree	(1) Parkinsonia microphylla
Shrub	(1) Ambrosia deltoidea(2) Encelia farinosa
Herbaceous	(1) Aristida purpurea

Physiographic features

This site occurs in the upper elevations of the Sonoran Desert in southern Arizona. Slope aspect is site differentiating at elevations near common resource area boundaries.

Table 2. Representative physiographic features

	. ,
Landforms	(1) Hill (2) Ridge
Flooding frequency	None
Ponding frequency	None
Elevation	671–1,067 m
Slope	15–45%
Aspect	N, E, S

Climatic features

Precipitation in the sub resource area ranges from 10 to 13 inches in the southern part, along the Mexican border with elevations from about 1900 to 3200 feet. Precipitation in the northern part of the resource area ranges from 11 to 14 inches with elevations from about 1700 to 3500 feet. Winter-summer rainfall ratios range from 40%-60% in the southern portions of the land resource unit, to 50%-50% in the central portions, to 60%-40% in the northern part of the land resource unit. As one moves from east to west in this resource area rains become slightly more unpredictable and variable with Coefficients of Variation of annual rainfall equal to 29% at Tucson and 36% at Carefree. Summer rains fall July through Sept., originate in the Gulf of Mexico, and are convective, usually brief, intense thunderstorms. Cool season moisture tends to be frontal, originating in the Pacific and Gulf of California. This winter precipitation falls in widespread storms with long duration and low intensity. Snow is rare and seldom lasts more than an hour or two. May and June are the driest months of the year. Humidity is generally very low.

Winter temperatures are mild, with very few days recording freezing temperatures in the morning. Summer temperatures are warm to hot, with several days in June and July exceeding 105 degrees F.

Both the spring and the summer growing seasons are equally important for perennial grass, forb and shrub growth. Cool and warm season annual forbs and grasses can be common in their respective seasons with above average rainfall. Perennial forage species can remain green throughout the year with available moisture.

Table 3. Representative climatic features

Frost-free period (average)	265 days
Freeze-free period (average)	0 days
Precipitation total (average)	330 mm

Influencing water features

There are no water features associated with this site.

Soil features

These are deep and moderately deep soils which have formed in gravelly loamy alluvium of mixed origin. They are not calcareous but calcareous horizons or bedrock may occur at moderate depths. Soil surfaces are well protected by gravel and cobbles. Plant-soil moisture relationships are good.

Soils mapped on this site include:

SSA-627 Southern Mohave County MU's Bucklebar-15 & Pinaleno-41;

SSA-645 Aguila-Carefree area MU Eba-41;

SSA-666 Northwest Cochise County MU Pinaleno-490;

SSA-668 Tucson-Avra Valley area MU's Rough Broken Land-Rw & Rxd;

SSA-669 Eastern Pima County MU Pinaleno-61;

SSA-703 Tohono O'odham area MU Caracara-17.

Table 4. Representative soil features

Surface texture	(1) Gravelly sandy loam (2) Very gravelly sandy loam
Family particle size	(1) Loamy
Drainage class	Well drained
Permeability class	Moderate to moderately slow
Soil depth	76–152 cm
Surface fragment cover <=3"	30–75%
Surface fragment cover >3"	1–30%
Available water capacity (0-101.6cm)	9.14–17.78 cm
Calcium carbonate equivalent (0-101.6cm)	0–10%
Electrical conductivity (0-101.6cm)	0–2 mmhos/cm
Sodium adsorption ratio (0-101.6cm)	0–2
Soil reaction (1:1 water) (0-101.6cm)	7–7.8
Subsurface fragment volume <=3" (Depth not specified)	35–60%
Subsurface fragment volume >3" (Depth not specified)	0–10%

Ecological dynamics

The plant communities found on an ecological site are naturally variable. Composition and production will vary with yearly conditions, location, aspect, and the natural variability of the soils. The Historical Climax Plant Community represents the natural potential plant communities found on relict or relatively undisturbed sites. Other plant communities described here represent plant communities that are known to occur when the site is disturbed by factors such as fire, grazing, or drought.

Production data provided in this site description is standardized to air dry weight at the end of the summer growing season. The plant communities described in this site description are based on near normal rainfall years.

NRCS uses a Similarity Index to compare existing plant communities to the plant communities described here.

Similarity Index is determined by comparing the production and composition of a plant community to the production and composition of a plant community described in this site description. To determine Similarity Index, compare the production (air dry weight) of each species to that shown in the plant community description. For each species, count no more than the maximum amount shown for the species, and for each group, count no more than the maximum amount shown for the group. Divide the resulting total by the total normal year production shown in the plant community description. If the rainfall has been significantly above or below normal, use the total production shown for above or below normal years. If field data is not collected at the end of the summer growing season, then the field data must be corrected to the end of the year production before comparing it to the site description. The growth curve can be used as a guide for estimating production at the end of the summer growing season.

State and transition model

MLRA 40-1 (10-13"), Loamy Slopes

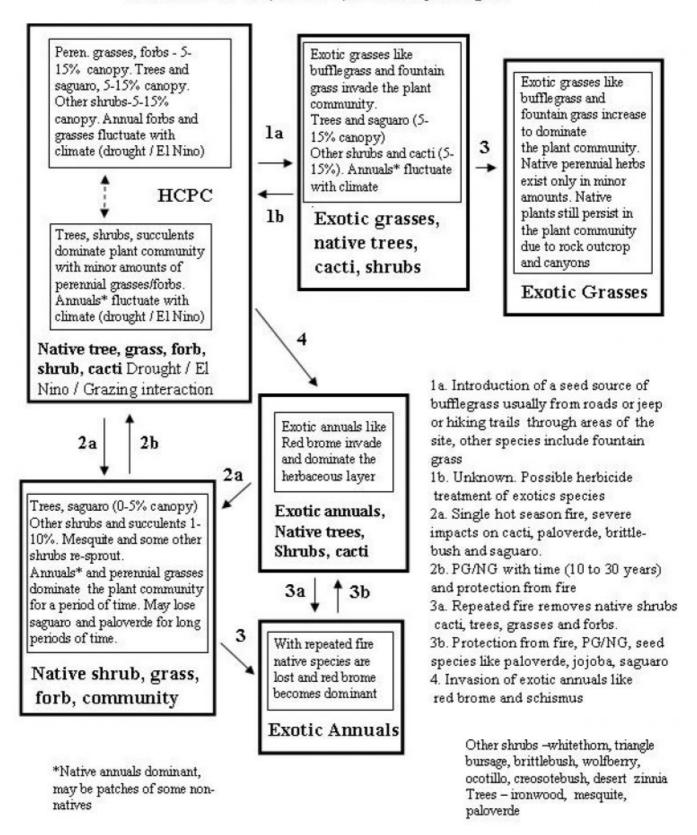

Figure 4. State and Transition model, Loamy Slopes 10-13" pz

State 1 Historical Climax Plant Community

Community 1.1 Historical Climax Plant Community

The potential plant community on this site is a diverse mixture of desert trees, shrubs, cacti, grasses, and forbs. The aspect is shrubland. With continuous, heavy grazing, perennial grasses and forbs are removed from the plant community and shrubs like brittlebush, triangle bursage, prickly pear, and white thorn acacia can increase to dominate the understories. Trees like littleleaf paloverde and mesquite can increase to dominate the overstory. Trees reach moderate size on this site. A 10-15% tree canopy is important on this site to keep diveristy in the understory plant community.

Table 5. Annual production by plant type

Plant Type	Low (Kg/Hectare)	Representative Value (Kg/Hectare)	High (Kg/Hectare)

State 2

Native tree, cacti and shrubs with fire

Community 2.1

Native tree, cacti and shrubs with fire

This plant community occurs as a result of a single hot season fire. Paloverde and saguaro can be severely impacted and may take long periods of time (30-50 years) to recover to pre-fire levels. Perennial and annual grasses and forbs dominate the community for some time until shrubs like bursage and brittlebush can recover. This plant community can produce enough herbaceous fuel from native species of grasses and / or forbs to carry fire in El Nino years or after unusually wet summers. The natural incidence of fire in this MLRA is very low and fires are much more common from man-made ignitions. Areas of the site close to urban zones or along heavily travelled roads and highways will experience a higher rate of fires.

State 3

Exotic perennial grasses with natives

Community 3.1

Exotic perennial grasses with natives

This community occurs where bufflegrass, natal grass or fountain grass invade the native plant community. These species occupy the niches of low shrubs like brittlebush or triangle bursage and woody forbs like janusia and twinberry.

State 4

Exotic perennial grasses and fire

Community 4.1

Exotic perennial grasses and fire

This community occurs where a native plant community that has been invaded by bufflegrass or fountain grass has burned one or more times. Increasing amounts of bufflegrass leads to more uniform fine fuels. In areas adjacent to roads and urban areas the risk of repeated fires will increase. As fire frequency increases the dominance of the exotic grasses increase.

State 5

Native plant community with exotic annuals

Community 5.1

Native plant community with exotic annuals

This plant community occurs where the native community has been invaded by red brome and / or schismus. Red brome occupies the niche of the native winter annual forbs and grasses. This exotic annual grass will fluctuate from nearly nothing in a dry winter to dominance of the understory plant community in a El Nino winter.

State 6

Exotic annuals and fire

Community 6.1

Exotic annuals and fire

This plant community occurs where a native plant community which has been invaded by red brome and / or

schismus has burned repeatedly. As fires become more frequent the native trees, shrubs and succulents are removed from the plant community and red brome becomes dominant. In areas of the site near urban areas and along heavily travelled roads this will be a more common occurence due to an increased source of ignitions.

Additional community tables

Animal community

Steep slopes and gravelly surfaces limit grazing distribution especially in the hotter months of the year. Stocker cattle will use areas of this site fairly well at any season. Forage species grow year round with available moisture. The potential plant community provides adequate nutrition for livestock throughout the year at low stocking rates.

Water developments are very important to wildlife species on this site. Vegetative cover, topography, and forage diversity are good enough for a great variety of wildlife including the larger desert mammals.

Hydrological functions

This site is a fair to good producer of runoff due to steep slopes and soils with argillic horizons near the surface.

Very gravelly and cobbly soil surfaces tend to hold water on the site.

Recreational uses

Hunting, hiking, birdwatching, photography, horseback riding, rock hounding.

Wood products

Some paloverde, ironwood and mesquite for camp-fires and branding fires.

Other products

Stones and cobbles, saguaro ribs, cholla skeletons. Tradtional foods like saguaro fruits, prickly pear tunas, cactus flower buds and jojoba nuts. Traditional herbs like coyote tobacco, mint bush, globe mallow and limberbush.

Type locality

Location 1: Pima County,	AZ
Township/Range/Section	T9S R18E S26
General legal description	Tucson FO - YLE Ranch
Location 2: Pima County,	AZ
Township/Range/Section	T20S R6E S29
General legal description	Sells FO - Chutum Vaya Assoc. unsurveyed - along San Juan Trail in Mtn. Pass
Location 3: Pima County,	AZ
General legal description	Catalina, Az. Waste Transfer Station, fenced in 1974.
Location 4: Pima County,	AZ
General legal description	Catalina State Park, Ridges along Sutherland and Canyon del Oro washes.

Rangeland health reference sheet

Interpreting Indicators of Rangeland Health is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

Author(s)/participant(s)	Dave Womack, Dan Robinett, Emilio Carrillo
Contact for lead author	NRCS Tucson Area Office
Date	03/08/2005

Composition (Indicators 10 and 12) based on	Annual Production

Indicators

1.	Number and extent of rills: None
2.	Presence of water flow patterns: Uncommon, probably cover no more than 10% of area; discontinuous; 10-15 feet in length.
3.	Number and height of erosional pedestals or terracettes: Pedestals are uncomon on perennial grass and shrubs; terracettes are uncommon.
4.	Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground): 15-20%
5.	Number of gullies and erosion associated with gullies: None
6.	Extent of wind scoured, blowouts and/or depositional areas: None
7.	Amount of litter movement (describe size and distance expected to travel): Most litter size classes stay in place.
8.	Soil surface (top few mm) resistance to erosion (stability values are averages - most sites will show a range of values): Expect values of 1-3 in canopy interspaces, 4-6 under plant canopies.
9.	Soil surface structure and SOM content (include type of structure and A-horizon color and thickness): Weak thin platy to weak granuar; color is 7.5-10YR4/4 dry, 7.5-10YR3/2 moist; thickness to 1 inch.
10.	Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff: Canopy cover 15-25%; 20-30% perennial grasses, 5% perennial forbs,40-50% trees and 10-20% shrubs and subshrubs. Cover is well dispersed throughout site.
11.	Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site): None
12.	Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):
	Dominant: trees > shrubs > annual grasses and forbs > succulents = perennial forbs = perennial grasses (Note: this is following several years of prolonged regional drought.)
	Sub-dominant:

	Other:
	Additional:
3.	Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence): 90-100% perennial grass plants have likely been lost in recent prolonged drought; 20-50% canopy mortality of shrubs and trees.
4.	Average percent litter cover (%) and depth (in):
5.	Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annual-production): 134 lbs/ac unfavorable precipitation; 500 lbs/ac normal precipitation; 1095 lbs/ac favorable precipitation.
6.	Potential invasive (including noxious) species (native and non-native). List species which BOTH characterize degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not invasive plants. Note that unlike other indicators, we are describing what is NOT expected in the reference state for the ecological site: triangle bursage, prickly pear, white thorn acacia, bufflegrass
