

## Ecological site R086AY010TX Northern Blackland

Last updated: 9/21/2023 Accessed: 05/03/2024

## **Rangeland health reference sheet**

Interpreting Indicators of Rangeland Health is a qualitative assessment protocol used to determine ecosystem condition based on benchmark characteristics described in the Reference Sheet. A suite of 17 (or more) indicators are typically considered in an assessment. The ecological site(s) representative of an assessment location must be known prior to applying the protocol and must be verified based on soils and climate. Current plant community cannot be used to identify the ecological site.

Composition (Indicators 10 and 12) based on	Annual Production

## Indicators

- 1. Number and extent of rills: None.
- 2. **Presence of water flow patterns:** Some water flow patterns are normal for this site due to landscape position and slope but should be vegetated and stable.
- 3. Number and height of erosional pedestals or terracettes: None.
- 4. Bare ground from Ecological Site Description or other studies (rock, litter, lichen, moss, plant canopy are not bare ground): Bare ground is essentially nonexistent.
- 5. **Number of gullies and erosion associated with gullies:** No gullies should be present. Drainageways should be stable and covered with vegetation.
- 6. Extent of wind scoured, blowouts and/or depositional areas: None

- Amount of litter movement (describe size and distance expected to travel): This site has slowly permeable soils. Due to density of vegetation, even on sloping sites, small to medium-sized litter will move very little during intense storms.
- 8. Soil surface (top few mm) resistance to erosion (stability values are averages most sites will show a range of values): Soil surface is resistant to erosion. Stability class range is expected to be 5 to 6.
- 9. Soil surface structure and SOM content (include type of structure and A-horizon color and thickness): Greater than 60 inches thick. Colors range from black to very dark brown and moderately fine to medium subangular blocky structure. SOM 1 to 3 percent.
- 10. Effect of community phase composition (relative proportion of different functional groups) and spatial distribution on infiltration and runoff: This prairie site is dominated by tallgrasses and forbs having adequate litter and little bare ground which can provide for maximum infiltration and little runoff under normal rainfall events.
- 11. Presence and thickness of compaction layer (usually none; describe soil profile features which may be mistaken for compaction on this site): None.
- 12. Functional/Structural Groups (list in order of descending dominance by above-ground annual-production or live foliar cover using symbols: >>, >, = to indicate much greater than, greater than, and equal to):

Dominant: Warm-season tallgrasses >>

Sub-dominant: Warm-season midgrasses >

Other: Forbs > Cool-season midgrasses > Trees > Shrubs/Vines

Additional:

- 13. Amount of plant mortality and decadence (include which functional groups are expected to show mortality or decadence): Grasses and forbs due to their growth habit will exhibit some mortality and decadence, though very slight. Open spaces from disturbance are quickly filled by new plants through seedlings and reproductive reproduction (tillering).
- 14. Average percent litter cover (%) and depth (in): Litter is primarily herbaceous.
- 15. Expected annual annual-production (this is TOTAL above-ground annual-production, not just forage annualproduction): 5,000 pounds per acre during below average moisture years to 8,000 pounds per acre above average moisture years.

degraded states and have the potential to become a dominant or co-dominant species on the ecological site if their future establishment and growth is not actively controlled by management interventions. Species that become dominant for only one to several years (e.g., short-term response to drought or wildfire) are not invasive plants. Note that unlike other indicators, we are describing what is NOT expected in the reference state for the ecological site: Potential invasive species include yellow bluestems, Bermudagrass, mesquite, elm, huisache, and eastern red cedar.

17. **Perennial plant reproductive capability:** All perennial plants should be capable of reproducing except during periods of prolonged drought conditions.
